

Digital Advertising Review

Data overview

Q01 What kind of advertising data is available?

At a glance

The project contains **400,000** events across **200** ads and **9,841** user records.

What the chart shows

The event mix chart shows that impressions make up most of the activity, followed by clicks and smaller actions such as likes, comments, shares, and purchases.

What this means

This gives the marketing team a useful base for looking at the full customer journey instead of only one headline number.

Advertising funnel

Q02 How many people move from seeing an ad to buying?

At a glance

There were 40,079 clicks and 2,031 purchases from 339,812 impressions.

What the chart shows

The funnel drops sharply as people move from impressions to clicks and then to purchases. That pattern suggests the main opportunity is not only gaining attention, but improving the steps after the click.

What this means

Review the landing page, offer, and checkout experience before simply increasing ad reach.

Platform reach

Q03 Which platform generated more attention?

At a glance

Facebook generated more impressions.

What the chart shows

The platform comparison shows that Facebook delivered the larger volume of impressions in this dataset. Instagram was still important, but its strength was not the same as Facebook's volume strength.

What this means

Keep Facebook as an important reach channel and use Instagram for more targeted testing rather than comparing the platforms on volume alone.

Platform click-through rate

Q04 Which platform encouraged more clicks?

At a glance

Instagram had the higher CTR at 11.86%.

What the chart shows

CTR compares clicks with impressions, so it helps show how strongly the ad message encouraged people to take the next step. Instagram led on this measure even though Facebook delivered more impressions.

What this means

Test Instagram creative more broadly, while checking whether the extra clicks also lead to valuable actions.

Platform purchase rate

Q05 Which platform converted clicks more efficiently?

At a glance

Facebook had the higher click-to-purchase rate at 5.21%.

What the chart shows

Facebook produced a better purchase rate after the click. This is an important difference from CTR: the platform that attracts the most interest is not always the platform that finishes the funnel best.

What this means

Use Facebook for conversion-focused campaigns and investigate what happens after the click on Instagram.

Ad format reach

Q06 Which ad format received the most exposure?

At a glance

Stories received the most impressions.

What the chart shows

The format chart shows where delivery volume was concentrated. High exposure is useful for awareness, but it does not by itself mean the format is the best at generating purchases.

What this means

Keep Stories in the media mix, then compare its purchase results before moving more budget into it.

Ad format click-through rate

Q07 Which format attracted the most clicks?

At a glance

Video had the highest CTR at 11.90%.

What the chart shows

Video led on click-through rate, which means it was effective at moving viewers from an impression to a click. This is a creative signal worth testing further.

What this means

Develop more video variations and compare whether the stronger click rate continues through the purchase stage.

Ad format purchase rate

Q08 Which format converted clicks most efficiently?

At a glance

Stories had the highest click-to-purchase rate at 5.34%.

What the chart shows

Stories led when the comparison starts with clicks and ends with purchases. This is different from the CTR result, so format decisions should use both attention and conversion measures.

What this means

Use Stories for conversion tests, but keep monitoring whether the result holds across campaigns and audiences.

Target gender

Q09 Which targeting group had the stronger purchase rate?

At a glance

All targeting had the higher click-to-purchase rate at 5.19%.

What the chart shows

The chart compares purchase rates for the available targeting groups. The 'All' group performed slightly better in this dataset, but the result should be read with audience size and campaign mix in mind.

What this means

Do not narrow targeting automatically; compare broad and focused audiences using the same creative and campaign objective.

Target age group

Q10 Which target age group converted clicks best?

At a glance

The 18–24 group had the highest click-to-purchase rate at 5.36%.

What the chart shows

The age comparison shows a modest difference between groups. It is useful for deciding where to run the next test, not for assuming that one age group will always perform best.

What this means

Test more creative variations with 18–24 audiences while keeping a broader control group.

Time of day

Q11 When did clicks most often turn into purchases?

At a glance

Morning had the highest click-to-purchase rate at 5.28%.

What the chart shows

The time-of-day chart compares conversion after a click. It helps answer a different question from total activity: the busiest period is not necessarily the most efficient period.

What this means

Use morning delivery as a test window, then confirm the result with a longer period before changing schedules.

Day of week

Q12 Which day had the strongest click-to-purchase rate?

At a glance

Thursday had the highest click-to-purchase rate at 5.58%.

What the chart shows

Thursday led the day-level comparison in the available records. Day-to-day differences can be affected by campaign timing and audience mix, so this should be treated as a planning signal.

What this means

Schedule a controlled Thursday test and compare it with nearby weekdays using the same campaign objective.

Country performance

Q13 Which country converted clicks most efficiently?

At a glance

Japan had the highest purchase rate among countries with at least 100 clicks: 6.25%.

What the chart shows

The chart focuses on countries with enough clicks to make the comparison more useful. Japan led on purchase rate, although the largest audience or impression market may be different.

What this means

Separate volume markets from high-intent markets and tailor the next budget review to both measures.

Campaign activity

Q14 Which campaign produced the most activity for its budget?

At a glance

Campaign 42 Summer generated the most recorded events per budget dollar.

What the chart shows

The chart compares budget with event volume. It is a simple efficiency view, not a return-on-investment calculation, because the source data does not contain revenue or actual spend by campaign.

What this means

Use this result to identify a campaign for review, then add spend and revenue data before making a budget decision.

Weekly activity

Q15 When was advertising activity at its highest?

At a glance

The busiest week began July 27, 2025, with 30,936 events.

What the chart shows

The weekly line shows when event activity rose above the normal level. Peaks can come from promotions, campaign launches, or changes in delivery, so the next step is to connect the spike to a campaign calendar.

What this means

Review the campaigns running that week and document what caused the increase before repeating it.
